

Typc active optical cable

Article Overview

Active Optical Cables (AOCs) are fiber-optic cables with integrated electronics, available in various types based on fiber mode, connector style, and application-specific features.

Overview of AOCs

An Active Optical Cable is a fiber-optic cable with built-in transceivers at each end that convert electrical signals to optical signals and back, enabling high-speed data transmission over longer distances than copper cables while remaining lightweight and flexible . AOCs are widely used in data centers, high-performance computing, and AV applications due to their low electromagnetic interference, compact design, and ease of installation .

Types of AOCs

1. Based on Fiber Mode

- Single-Mode AOCs: Transmit a single light mode, offering very low attenuation and supporting long-distance transmission, often exceeding 10 km . Ideal for backbone connections or inter-building links.
- Multi-Mode AOCs: Transmit multiple light modes, suitable for shorter distances (typically up to 100-300 meters). Multi-mode fibers are further classified as OM1, OM2, OM3, OM4, and OM5, with OM3-OM5 optimized for high-speed networks like 40G, 100G, and 400G
