

VLAN partitioning rules for aggregation switches

Article Overview

VLAN aggregation (super-VLAN) allows multiple VLANs to share a single IP subnet on an aggregation switch, reducing IP address waste while isolating broadcast domains.

Overview of VLAN Aggregation

VLAN aggregation, also called super-VLAN technology, partitions a physical network into multiple sub-VLANs and aggregates them under a single super-VLAN. Each sub-VLAN isolates a broadcast domain, but all sub-VLANs share the same IP subnet, default gateway, and directed broadcast address. This approach conserves IP addresses and allows hosts in different broadcast domains to communicate using the same subnet without requiring separate Layer 3 interfaces for each VLAN .

- Super-VLAN: A logical Layer 3 entity that represents a subnet. It does not contain physical interfaces but provides the Layer 3 interface for all associated sub-VLANs.
- Sub-VLAN: Contains physical interfaces and isolates broadcast domains. Hosts in a sub-VLAN use the super-VLAN's Layer 3 interface for external communication.

Benefits

- IP Address Efficiency: Sub-VLANs share the same subnet, reducing the number of subnet IDs, default gateways, and broadcast addresses required .
- Flexible Addressing: Hosts in different sub-VLANs can be assigned IP addresses from the same subnet, eliminating unused IP addresses in small VLANs .
- Simplified Layer 3 Configuration: Only one Layer 3 interface is needed per super-V...
