

Visualization of Relay Protection Actions

Overview

This paper presents an improved method for post-mortem analysis of relay response to disturbances from DFR data. Specifically, a visualization application for the operation of protective relays using digital fault recorder data is presented. Browser-based tools for first-pass event review, overcurrent coordination, directional logic, phasor interpretation, Fortescue component analysis, and more, built for studies, fault analysis, technical explanation, and training. Open COMTRADE Waveform, timing, phasors, cursors. Traditionally, a two-step procedure is applied to minimize. To ensure that protective relays, circuit breakers, and other protection devices correctly and selectively isolate faults, minimizing damage to equipment and interruptions to customers while maintaining system stability. One-line diagrams and detailed network data (lines, transformers, buses).
