

# What is a finished optical cable

## Overview

Terminating fiber optic cables starts with a process called finishing. This is where the end of fiber and the ferrule that holds it in the connector are polished to give a uniformly flat and clear surface for the best optical performance and minimal signal loss. These cables are used mainly for digital audio connections between devices. A fiber-optic cable, also known as an optical-fiber cable, is an assembly similar to an electrical cable but containing one or more optical fibers that are used to carry. A fiber optic cable is a thin strand of glass or plastic that transmits data as pulses of light instead of electrical signals. The process demands extraordinary chemical purity, because even a few parts per billion of the wrong impurity can degrade a light signal. What is an Optical Cable?

Optical cables, also known as fiber optic cables or TOSLINK cables, use light to transmit audio and video signals from one device to another.
