

What is the module for adjusting high and low beams called

Overview

A lighting control module (LCM) is an electronic component that acts as the "brain" of a car's lighting system. It processes signals from various sensors and switches to regulate the operation of headlights, taillights, turn signals, daytime running lights, and other lighting. Chances are, the lighting control module (LCM)—also known as the footwell module (FRM) in BMW models—is the root cause. In this guide, we'll. The High Beam Control System (HBC) determines the conditions in front of the vehicle using the Forward Sensing Camera (FSC) while driving in darkness to automatically switch the headlights between high and low beams. Refer to Warning/Indicator Lights on. These systems aim to provide optimal illumination in all driving scenarios, enhancing safety.
