

What size clamp should be used for a 24-core fiber optic cable

Overview

For 24-core ADSS on spans ≤ 300 m, preformed rod suspension clamps are the standard choice — they distribute load across the armor rod length and are less sensitive to installation torque errors than wedge types. When managing large cable bundles—whether they include thick Ethernet runs, multi-strand fiber trunks, or low-voltage power cables—the right cable clamp configuration plays a major role in long-term reliability, safety, and organization. Using properly sized and appropriately spaced clamps prevents. That breadth is useful for a general audience, but it leaves a gap: the engineer who only needs to spec clamps for a 24-core ADSS project does not want to scroll past 96-core span tables to find what applies to their cable. This article focuses exclusively on 24-core ADSS — the workhorse fiber. In 4G/5G networking, the telecommunication projects will use more and more combined cable clamps, which need to fix both power cables (DC) and fiber optic cables (FO). Volda supplies a broad spectrum of fiber cable clamps, for example: 4-7mm, 6-9mm, 4.
