

What switches are in the distribution box

Article Overview

Switches in a distribution box control and protect electrical circuits, including the main switch for overall power and individual circuit breakers for specific circuits.

Main Switch

The main switch, also called the main breaker, controls the entire electrical supply to the distribution box. It allows you to disconnect all power to the building during emergencies or maintenance work and is typically rated for the maximum current capacity of the electrical service . This switch ensures that the entire system can be safely shut down when needed.

Circuit Breakers

Circuit breakers are automatic switches that protect individual circuits from overcurrent conditions. When too much current flows through a circuit, the breaker trips and interrupts the power flow, preventing damage to appliances and reducing fire risks . Each breaker corresponds to a specific circuit, such as lighting, outlets, or major appliances like air conditioners and water heaters.

Additional Switches and Indicators

Some distribution boxes include additional switches for specialized equipment or sub-circuits, as well as indicators like LED lights to show the status of the mains power or individual circuits . In modern or smart distribution boxes, these switches may integrate with energy monitoring systems or home automation for remote control a...
