

What type of elbow is used for turning horizontal cable trays

Article Overview

Horizontal elbows are the standard fittings used to turn cable trays in a horizontal plane, available in various angles such as 30° and 90° to suit installation needs.

Overview

A horizontal elbow is a cable tray fitting designed to change the direction of a cable tray along the horizontal plane without altering its elevation. These elbows are essential for routing cables around corners or obstacles while maintaining proper cable support and organization .

Types of Horizontal Elbows

- 30° Horizontal Elbow: Ideal for installations with large-diameter cables or long spans, this elbow provides a smooth transition between straight sections and reduces overall tray width. It is compatible with NEMA Classes 12B, 12C, 20A, 20B, 20C, and higher .
- 90° Horizontal Elbow: Commonly used for sharp turns in cable tray runs, available in ladder or I-beam styles. These elbows are compatible with multiple NEMA classes and provide a robust solution for heavy-duty cable installations .
- Horizontal Flat Elbow: Maintains a low profile while redirecting cables horizontally, suitable for installations where vertical clearance is limited. These elbows are typically made from hot or cold rolled steel, electro-galvanized steel, or stainless steel, with finishes like epoxy powder coating or hot-dip galvanization
