

What type of fusion splicer is used for optical cables

Article Overview

Cladding alignment fusion splicers are typically used for ordinary optical cables due to their affordability and sufficient precision for standard installations.

Overview

Fusion splicers join two optical fibers end-to-end by melting them together with an electric arc, creating a low-loss, reliable connection essential for fiber optic networks . There are two main types of fusion splicers based on alignment methods:

- **Core Alignment Splicers:** These use cameras and sensors to precisely align the fiber cores. They provide the lowest splice loss and are ideal for high-bandwidth, long-distance, or critical backbone networks .
- **Cladding Alignment Splicers:** These align the outer cladding of the fibers rather than the cores. They are faster, more cost-effective, and suitable for routine installations where ultra-low loss is not critical, such as access networks, LANs, or FTTH deployments .

Why Cladding Alignment is Preferred for Ordinary Cables

For ordinary optical cables, such as those used in local area networks or standard field installations:

- **Cost Efficiency:** Cladding alignment splicers are generally less expensive than cor...
