

Which cable trays are fireproof

Article Overview

Fireproof cable trays come in ladder, trough, basket, and specialized composite designs, made from materials like steel, aluminum, fiberglass, and fiber-reinforced cement to resist fire and environmental hazards.

Common Types of Fireproof Cable Trays

1. Ladder Trays Ladder trays feature rungs that allow air circulation, reducing overheating risks. They are ideal for heavy-duty applications and can support large bundles of cables while maintaining fire safety standards. Their open design also facilitates inspection and maintenance, making them suitable for industrial and commercial installations . 2. Trough Trays Trough trays provide a solid base for cables, offering enhanced protection against physical damage and fire exposure. They are often used in environments where cables need additional shielding from heat, sparks, or falling debris . 3. Basket Trays Basket trays are made of wire mesh, making them lightweight and easy to install. They are suitable for commercial buildings, data centers, and areas where flexibility and rapid installation are important. Despite their open structure, they can be combined with fire-resistant coatings or wraps to enhance fire protection . 4. Composite or Specialized Trays Some fireproof trays, like Sinisi Cable Trays, use two metal face sheets bonded to a fiber-reinforced cement core. These trays are exceptionally robust, resistant to fire, blast, and impact, and are ideal for harsh industrial or outdoor environments .
