

Wiring of 18 circuits in the distribution box

Article Overview

An 18-circuit distribution box is wired by connecting the incoming supply to the main switch, then distributing power through protective devices to each circuit, with neutrals and earths properly linked and all circuits clearly labeled.

Components Overview

An 18-circuit distribution box typically includes:

- Main switch or double-pole MCB to control the incoming supply.
- RCCB or RCD for leakage and shock protection.
- MCBs or RCBOs for each of the 18 outgoing circuits.
- Neutral bar to distribute neutral connections.
- Earth bar for grounding all circuits.
- Busbars for phase distribution.
- Optional Surge Protective Device (SPD) if required by risk assessment .

Wiring Sequence

- Incoming Supply Connection: Connect the phase and neutral from the utility or meter to the main switch or isolator. This acts as the primary control for the entire board .
- RCCB/RCD Connection: The output of the main switch feeds the input of the RCCB. The RCCB protects against leakage currents and electric shocks .
- Branch Circuit Distribution: Connect the output of the RCCB to the input terminals...
