

# Wiring of the direct fuse plate in the optical distribution box

## Article Overview

The direct fuse plate in an optical distribution box is wired by securing the main fiber cable, routing branch fibers to adapters, and maintaining proper bend radius to ensure fiber integrity.

### Step 1: Prepare the Main Fiber Cable

Before wiring, remove the outer sheath of the main optical cable, leaving the loose buffer tubes and strength members intact. Use cable seals and hose clamps to secure the main cable at the entry point of the ODB, ensuring it is firmly fixed to prevent movement or tension on the fibers. The strength members should be pinned down with a metal plate or similar fixture to provide mechanical stability.

### Step 2: Install the Direct Fuse Plate

The direct fuse plate, often part of the front panel, is where individual fibers are terminated or spliced. Mount the plate securely in the ODB, ensuring it aligns with the adapter panels or splitters. The plate should allow easy access for connecting pigtails or pre-terminated jumpers while keeping fibers organized.

### Step 3: Route and Secure Fibers

Route the main fibers from the entry point to the direct fuse plate using trunk routing paths. Use bend radius control clips to prevent exceeding the minimum bend radius...
