

Wiring of the electrical distribution box for the storefront

Article Overview

Properly wiring a distribution box in a storefront involves careful planning, correct breaker and wire selection, safe connections, and compliance with electrical codes to ensure safety and reliability.

Planning and Preparation

Before starting, turn off the main power supply to prevent electrical shock. Determine the location of the distribution box, ideally in a dry, accessible area at about 1.5 meters height, with good ventilation and free from obstructions . Choose a box with the appropriate IP/NEMA rating for indoor commercial use, and ensure it can handle the expected load . Prepare all necessary materials: circuit breakers, wires, wiring ties, and tools according to your electrical plan .

Circuit Design and Wire Selection

Design the circuits based on the storefront's electrical needs, including lighting, outlets, HVAC, and equipment. Select wire sizes according to load: typically, 2.5mm² for lighting and sockets, and 2.5–4.0mm² for air conditioning or heavier loads . Use color-coded wires for clarity: blue for neutral, yellow/green/red for phases A/B/C . Each circuit should have its own breaker and protection device, such as fuses or surge protectors .
